TCYSA Return to Play Guidelines

1. Be smart: if you are sick, stay home. This applies to everyone: players, coaches, and parents. If you have been sick, stay home for 14 days after recovery.
2. Screening: Greet all participants before practice and ask if they have been sick in the last 14 days or in direct contact with a person who is sick. Send home immediately if the answer is "yes."
3. Sanitize: have hand sanitizer available and encourage hand washing before and after all activities.
4. Group play: all activities must be limited to the max number allowed in the current phase.
5. Physical play: facilitate soccer activities that eliminate physical contact. All drills and small-sided games should have as little physical contact as possible. Tackling, shielding, etc. should not be included in small-sided games or drills.
6. No high-fives, handshakes, or hugs: as much as we want to physically connect, this is not a safe practice for anybody right now.
7. Masks: coaches and spectators must wear a mask before, during, and after practice. Players must wear a mask when not actively practicing or playing.
8. Drop-off/pick-up: if possible, parents should remain in car for drop-off and pick-up. All spectators must remain 6 feet apart.
9. Water bottles: to minimize accidental sharing of water, players must keep their water bottles in their own bag when not in use.
10. Follow Washington State Dept of Health Contact Tracing Guidelines.
11. Have fun, stay positive: everyone is looking to each other to stay calm, supportive, and compassionate during this time.

How will my workplace/business/organization be notified if an employee, student or someone else connected tested positive for COVID-19?

Because of Washington State legal requirements for confidentiality, Public Health does not notify an employer, business, or organization if there is a confirmed case of any infectious disease reported to us, including COVID-19.

The process Public Health follows is:

- If a case is laboratory confirmed, the lab will notify Public Health's Disease Control and Prevention staff.
- Public Health contacts the confirmed COVID-19 individual and works with them to identify anyone they came in close contact (defined below) with. Public Health then contacts each of those individuals to notify them of potential exposure.
- Public Health asks the confirmed COVID-19 individual to notify their employer, if they are in the workforce, and notify Public Health when that has been done.
    - If the workplace is a school, Public Health staff will then work with the school to identify close contacts and determine next steps for the school.
    - If the workplace is an agency or organization, the agency or organization often contacts Public Health and works with us to determine next steps and to notify other employees or others who may have come in close contact.
